

# Architecture 04: Nginx Reverse Proxy + Multiple Web Services

gateway/proxy pattern template이다. web-a와 web-b는 host port를 직접 공개하지 않고, 외부 traffic은 proxy의 18089로만 들어온다. proxy 설정은 service name web-a, web-b를 upstream으로 사용한다.

## Run

```
docker compose config
docker compose up -d
docker compose ps
```

## Check

```
curl -s http://localhost:18089/a/
curl -s http://localhost:18089/b/
docker compose logs proxy --tail 40
docker compose ps
```

Expected:

```
Web A  
Web B
```

## Failure drill

---

```
docker compose stop web-b  
curl -i http://localhost:18089/b/ || true  
docker compose logs proxy --tail 20  
docker compose up -d web-b
```

upstream 하나가 죽어도 proxy의 로그가 원인 힌트를 준다. Week 3 MSA에서 service 장애 전파를 설명할 때 다시 쓰는 패턴이다.

## Cleanup

---

```
docker compose down
```
